PLEASE CREATE AN MVP

Yes—here is a lean MVP for SnapShare focused on the exact job users want done: scan a business card, confirm the data, save the contact, and push the lead into GoHighLevel with optional follow-up. Since GoHighLevel already exposes Contacts and Opportunities APIs, the MVP should be designed around direct contact creation/upsert plus optional pipeline creation instead of building a separate lead database first.[1] [2] [3] [4] [5]

MVP scope

The MVP should target solo users and small sales teams who meet prospects in person and need a fast path from paper card to CRM record. The core value is speed and low friction, which aligns with mobile onboarding best practices that favor camera capture, inline verification, and short thumb-friendly steps.[3] [6] [7] [8] [9]

Build only these 5 flows:

1. Scan front of card, with optional back scan for notes or secondary info.[10] [11]
2. OCR extract name, phone, email, company, title, website, and address.[11] [10]
3. Let the user verify and edit fields on one screen before saving.[12] [3]
4. Save to device contacts and upsert into GoHighLevel as a contact.[1]
5. Optionally create an opportunity and trigger an SMS/email follow-up workflow.[5] [10]

MVP features

This should be the first release feature set, not the full product vision. The goal is a simple tool, because users repeatedly prefer direct CRM sync and minimal manual entry over bloated networking features.[13] [11]

Feature	MVP?	Why it matters
Camera card capture	Yes	Core action; mobile-first capture reduces manual entry. [3] [6]
OCR extraction	Yes	Main time-saving feature. [10] [12]
Editable review screen	Yes	Inline verification reduces OCR errors and drop-off. [3]
Save to phone contacts	Yes	Users expect immediate utility outside the app. [1]
GoHighLevel contact upsert	Yes	Prevents duplicate mess and creates CRM value fast. [1]
Tag/source/event fields	Yes	Enables pipeline routing and campaign segmentation. [13] [11]
Create opportunity in GHL	Yes	Converts a scanned card into an active sales item. [5]

Feature	MVP?	Why it matters
Send text/email follow-up	Yes	Makes the scan actionable right away. [10]
Team workspaces	No	Useful later, but adds permissions/admin complexity too early. [11]
AI enrichment / LinkedIn scraping	No	Nice later, but not required to prove value. [11]
Business card wallet / social profile	No	Risks bloating the product away from the main use case. [9] [14]

User flow

The cleanest MVP flow is: open app → scan card → review extracted info → tap save → choose follow-up and pipeline options → done. That flow fits the recommendation to keep onboarding short, mobile-first, and broken into micro-actions with immediate feedback.[6] [3] [10]

A practical 4-screen version:

- Screen 1: Camera capture with “Scan card” and “Use photo” options.[3]
- Screen 2: OCR results with low-confidence fields highlighted for correction.[12] [3]
- Screen 3: Save options, “Add to Contacts,” “Push to GoHighLevel,” and “Create Opportunity.” [5] [1]
- Screen 4: Follow-up chooser, “Send intro text,” “Send intro email,” or “Skip.” [10]

Example follow-up logic:

- If phone exists, offer SMS.
- If email exists, offer email.
- If both exist, default to the method the user selects once in settings.
- If neither exists, save as partial lead with a “Needs review” tag.[1] [12]

Data model

The MVP should keep the schema minimal so CRM mapping stays reliable. GoHighLevel’s Contacts API supports create and upsert behavior, and its duplicate handling follows the location’s email/phone duplicate settings, which makes email/phone your primary identifiers. [1]

Suggested SnapShare fields:

- First name
- Last name
- Mobile phone
- Work phone
- Email
- Company

- Job title
- Website
- Address
- Notes
- Card image URL
- Source = “SnapShare”
- Event name
- Owner/user ID
- Tags, for example `networking-event`, `card-scan`, `hot-lead` [11] [1]

Suggested GHL mapping:

- Contact record via Upsert Contact.[1]
- Opportunity record only when user toggles “Add to pipeline.” [5]
- Pipeline stage selected from preset defaults like New Lead, Contacted, or Follow Up Needed.[5]

Tech stack

For the MVP, use the fastest path to a working mobile product with reliable OCR and direct API integration. Since your goal is a business-ready prototype rather than deep native complexity on day one, the stack should optimize for speed of shipping and iteration.[3] [12]

Recommended stack:

- Front end: Flutter or React Native for iOS/Android from one codebase.
- OCR: Google ML Kit or AWS Textract as the initial extraction engine.
- Backend: Supabase or Firebase plus a lightweight Node API layer for secure GoHighLevel token handling.
- CRM integration: GoHighLevel Contacts API first, Opportunities API second.[5] [1]
- Auth: Email magic link or Google/Apple sign-in.
- Storage: Secure card-image upload with temporary encrypted storage.

What to delay

Do not include a marketplace of digital cards, public profiles, chat, advanced analytics, team billing, social graph features, or heavy enrichment in version one. Those features may help later, but they are not required to validate whether users want a faster scan-to-CRM workflow.[14] [9] [3] [11]

Delay these until after traction:

- Badge scanning
- QR profile sharing

- Multi-user org permissions
- AI lead scoring
- Auto-enrichment from web sources
- Bulk exports
- Deep analytics dashboards [13] [11]

Success metrics

The MVP is working if users can get from card photo to CRM lead in under 30 seconds with minimal correction required. The clearest early KPIs are scan completion rate, field correction rate, contact sync success, opportunity creation rate, and follow-up send rate.[3] [10] [12] [11]

Use these launch targets:

- 80%+ of scans reach “saved” status.
- Median scan-to-save time under 30 seconds.
- Less than 2 manual field edits per average card.
- 95%+ successful GHL contact syncs.
- 30%+ of saved leads trigger SMS or email follow-up.[3] [1] [5]

Build order

Here is the leanest development sequence:

1. Card capture plus OCR.
2. Review/edit screen.
3. Save to phone contacts.
4. GoHighLevel contact upsert.[1]
5. Opportunity creation.[5]
6. SMS/email follow-up templates.
7. Tagging, source attribution, and simple dashboard counts.[11]

A strong MVP positioning line would be: SnapShare turns paper business cards into saved contacts and live GoHighLevel leads in seconds. Would you like the next step to be a full PRD, wireframe screen list, or database/API spec? [1] [5]
